

Unique cutting geometry

PRIMO 200E is a new single-side mounted dry-cut strand pelletizer with an extra-large cutting width of 200mm from Automatik-Maag. It achieves both user friendliness and high productivity levels. Its unique cutting geometry, with the shortest unguided length between the feed rolls and the cut, enables optimum straight cutting of both hard and very soft plastic strands. The pellet dimensions can

be quickly changed by means of an optional automatic pellet length adjuster. This is done using a second drive motor for the feed mechanism with an integrated speed control.

- Automatik-Maag is represented Africa by Joesten International.
